Conclusions and future studies

The building survey and dendrochronological analysis shows that this building is one of the oldest known corner timbered buildings, dating possibly as early as 1219.

The tithe barn makes an important element in the scarce collection of medieval corner timbered buildings. We can by the building and traces get information about the architecture and organization of space in a medieval tithe barn. The obvious conclusion is that the tithe barn counted as a representative building. It was given a pregnant architecture by means of skilful craftsmanship. What is notable is also the relationship between the preserved timbered churches. The religious buildings, distinct from the profane medieval timbered houses, is characterized by the pro-
